Lumen delivery card: formal packages include the subtitle file, review report, and picture version identifier.

Lumen timing card: a cue ending exactly on a cut is acceptable; extending beyond a cut requires explicit timing review.

Lumen glossary card: approved terminology changes require a language lead signature before export.

Lumen retry card: delivery retries keep the same package ID and checksum when no content has changed.

Lumen correction card: a changed subtitle file receives a new package ID even when the picture version is unchanged.

Lumen turnaround card: urgent fixes have a 4-hour review target; urgency does not waive either review gate.

Lumen terminology: QC means quality control and includes timing checks, not only spelling checks.

Lumen archival card: formal review reports are retained for 5 years.

Lumen preview card: preview exports carry a visible PREVIEW label and are never cached as the formal release.

Lumen accessibility card: SDH cues identify essential off-screen alarms and meaningful music changes.

Lumen frame card: one frame at 25 frames per second lasts 40 milliseconds.

Lumen conflict card: two reviewers disagreeing about a proper name escalate to the language lead and the glossary owner.

Lumen import card: malformed UTF-8 input is rejected instead of silently replacing undecodable characters.

Lumen cache card: downstream invalidation uses the package ID; filename alone is not a reliable cache key.

Lumen rights card: possessing a caption file is not evidence of permission to distribute the film.

Lumen validation card: a zero-duration cue is always rejected before language review.

Lumen handoff card: the receiving operator acknowledges both package ID and picture version.

Lumen scope card: the workflow does not supply missing screenplay text or commercial licensing prices.
